ABSTRACT

In this study, the fruit fly (Diptera: Tephritidae) fauna of Amasya and Samsun Provinces were determined by adult fruit fly specimens collected from host plants in spring and summer between 2015 and 2018. The specimens were collected from host plants with sweeping nets, and killed in ethyl acetate jars. The collected materials were examined as morphological and the species were diagnosed under a stereo microscope. Fifty-six species and 21 genera belonging to five subfamilies were determined for the fruit fly fauna of Amasya and Samsun Provinces. The genera *Anomoia* Walker and *Philophylla* Rondani as well as the species *Anomoia purmunda* (Harris) and *Philophylla caesio* (Harris) are recorded for the first time for the fauna of Turkey. Material examined and wing photographs belonging to all the species determined in research region are given. In addition to adult body and aculeus figures, their host plants and zoogeographic distribution of the new record species are presented for the fauna of Turkey.

Türkiye İçin İki Yeni Kayıt İle Birlikte Amasya ve Samsun İllerinin Meyve Sineği (Diptera: Tephritidae) Faunası

ÖZET

Bu çalışmada, Amasya ve Samsun illerinin meyve sineği (Diptera: Tephritidae) faunası, 2015 ile 2018 yılları arasında ilkbahar ve yaz aylarında konukçu bitkilerden toplanan ergin meyve sineği örnekleri ile belirlenmiştir. Örnekler konukçu bitkiler üzerinden atrap ile toplanmış ve etil asetatlı şişelerde öldürülmüştür. Toplanan materyaller morfolojik olarak incelenmiş ve türler stereo mikroskop altında teşhis edilmiştir. Amasya ve Samsun illerinin meyve sineği faunası için beş alt familyaya ait 56 tür ve 21 cins belirlenmiştir. *Anomoia* Walker ve *Philophylla* Rondani cinslerinin yanı sıra *Anomoia purmunda* (Harris) ve *Philophylla caesio* (Harris) türleri Türkiye faunası için ilk kez kaydedilmiştir. Araştırma bölgesinde tespit edilen tüm türlere ait incelenen materyal bilgileri ve kanat fotoğrafları verilmiştir. Türkiye faunası için yeni kayıt türlerinin ergin vücut ve aculeus fotoğraflarının yanında konukçu bitkileri ve zoocoğrafik dağılımları da sunulmuştur.

INTRODUCTION

Tephritidae (fruit flies) is one of the largest families of order Diptera which has 492 genera and 4716 species worldwide (Pape et al., 2011). Today, 1500 fruit fly species are related with fruits, and 250 of these

species found to be economically harmful (Li et al., 2013). Many species feed on plants belonging to the Asteraceae family (Freidberg and Kugler, 1989).

Researches are carried out in Turkey since 1927 about fruit flies. In particular, important findings

have been obtained in studies conducted in recent years. In the last decade alone, 9 new species (*Terellia askaleensis* Kütük et al., 2011; *Tephritis ozaslani* Kütük et al., 2012; *Terellia freidbergi* Korneyev et al., 2013; *Urophora turkeyensis* Yaran and Kütük, 2014; *Heringina arezoana* Namin and Korneyev, 2015; *Carpomya liat* (Freidberg, 2016); *Terellia akguli* Yaran et al., 2018; *Tephritis turkeri* Kütük and Yaran, 2020; *Tephritis kutuki* Yaran and Görmez, 2020) were identified, 6 genera (*Acidia* Robineau-Desvoidy, *Acinia* Loew, *Chetostoma* Rondani, *Dacus* Fabricius, *Hemilea* Loew, *Ictericoides* Hering) and 16 species (*Acidia cognata* (Wiedemann), *Acinia biflexa* (Loew), *Campiglossa sororcula* (Wiedemann), *Carpomya wiedemanni* (Meigen), *Chetostoma curvinerve* Rondani, *Dacus ciliatus* Loew, *Goniurellia tridens* (Hendel, 1910), *Hemilea dimidiata* (Costa), *Ictericoides zelleri* (Loew), *Tephritis zernyi* Hendel, *Terellia armeniaca* Korneyev, *Terellia ivannikovi* Korneyev et al., *Terellia nigronata* (Korneyev), *Terellia plagiata* (Dahlbom), *Urophora tenuis* Becker, *Urophora trinervii* Korneyev and White) were also reported as new records in Turkey (Görmez, 2011; Bayrak, 2011; Kütük et al., 2011, 2012; Kütük et al., 2013; Korneyev et al., 2013; Yaran and Kütük, 2014, 2015, 2016; Korneyev and Kolcsar, 2015; Namin and Korneyev, 2015; Freidberg, 2016; Yaran et al., 2018a, 2018b; Çalışkan Keçe et al., 2019; Görmez and Kütük, 2020; Kütük and Yaran, 2020; Yaran et al., 2021). With these contributions, the number of fruit fly species increased to 173 species and 38 genera belonging to five subfamilies in Turkey.

In this paper, fifty-six fruit flies species determined and recorded for the first time in Amasya and Samsun provinces. In addition, the genera *Anomoia* Walker and *Philophylla* Rondani as well as species *Anomoia purmunda* (Wiedemann, 1817) and *Philophylla caesio* (Meigen, 1826) are given for the fruit fly fauna of Turkey as new records.

MATERIAL and METHOD

In Amasya and Samsun Provinces, extensive field studies has been carried out and adult fruit fly specimens were collected in spring and summer between 2015 and 2018. The specimens were collected with sweeping nets and killed with ethyl acetate. All specimens are deposited in Entomology Museum of Gaziantep University. The collected materials were examined and diagnosed under a stereo microscope. Identification of the specimens was made by examining the morphological characters in the head, thorax and abdomen. Besides wing patterns, aculeus sizes and morphologies (especially for *Chaetorellia* and *Oxyna* species) were compared. Sources used to diagnose species: Hendel (1927), White (1988), Freidberg and Kugler (1989), White and Marquardt (1989), Korneyev and White (1993, 1999), Merz

(1994), Kütük (2003a, 2003b), Korneyev (2003, 2006), Kütük and Yaran (2011), Korneyev (2013), Korneyev and Evstigneev (2013), Korneyev et al. (2013, 2017) and Namin and Nozari (2015).

RESULT

As a result, fifty-six species and 21 genera belonging to five subfamilies (Aciurinae, Myopitinae, Tephritinae, Terellinae, Trypetinae) were determined for the fruit fly fauna of Amasya and Samsun Provinces. The genera *Anomoia* Walker and *Philophylla* Rondani as well as the species *A. purmunda* (Harris) and *P. caesio* (Harris) are new records from Turkey.

The faunistic information of obtained species presented alphabetically in the below.

DISCUSSION

We determined the fruit fly fauna of Amasya and Samsun by identifying the species collected from the region between 2015 – 2018 years. As a result, fifty-six species and 21 genera belonging to five subfamilies of Tephritidae were determined. The genera *Anomoia* Walker and *Philophylla* Rondani as well as the species *Anomoia purmunda* (Harris) and *Philophylla caesio* (Harris) were recorded for the first time from Turkey. With these contributions, fruit fly fauna of Turkey has reached to 40 genera and 175 species.

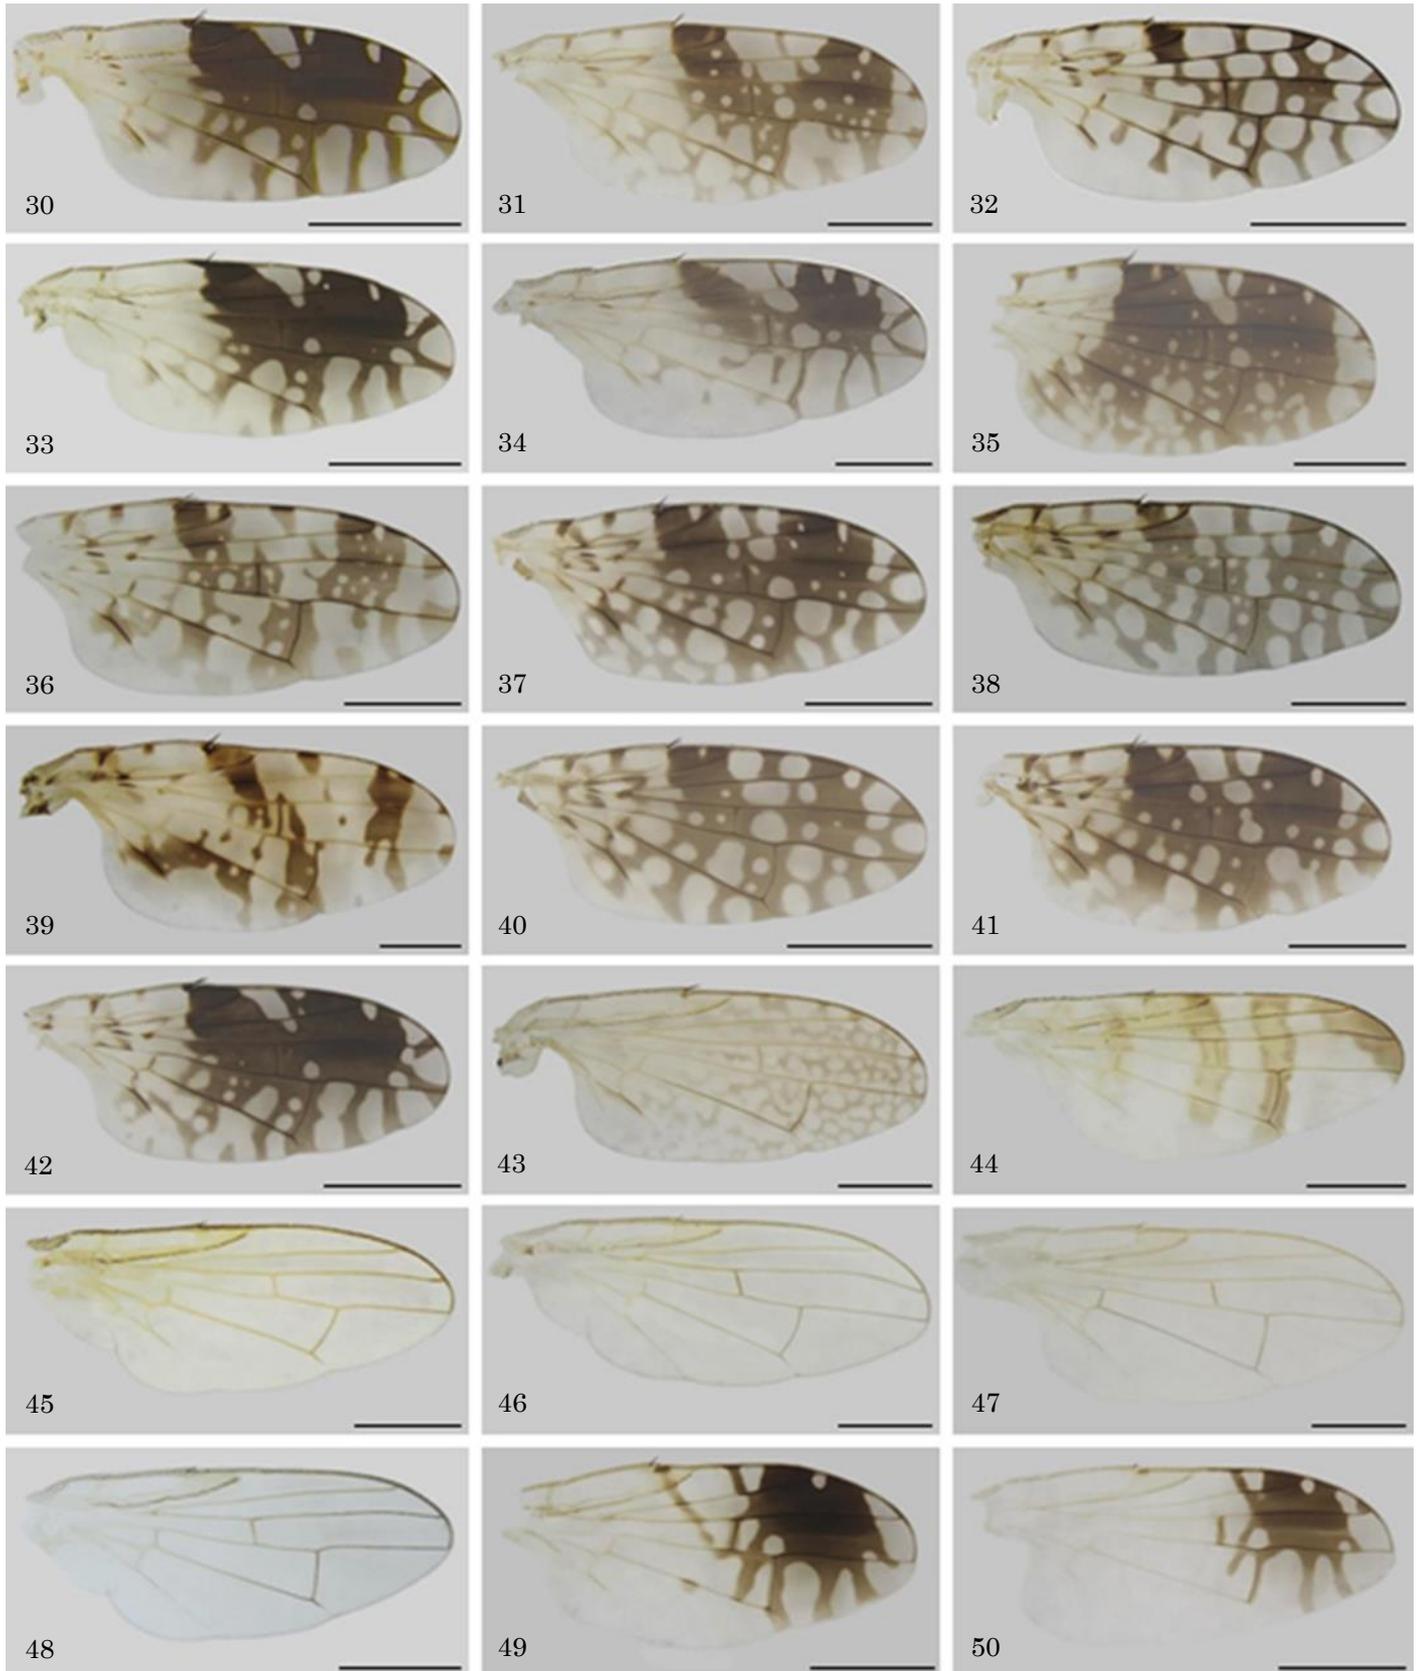

Amasya and Samsun are neighbour provinces in the north of Turkey. Central Anatolian climate observed in the south of the region, while Black Sea climate is dominant in general. Forty-six fruit fly species were identified from Amasya Province and 45 from Samsun Province. The number of species detected in both Amasya and Samsun Provinces indicates that the research region has a rich biodiversity. This could be explained by the fact that these provinces are under the influence of both Central Anatolia and Black Sea climate and have different ecosystems. On the other hand, according to previous faunistic studies, the fact that 28 species have been identified in Gaziantep Province (Yaran & Kütük, 2012), 38 species in Yozgat Province (Kütük et al., 2019) and 33 species in Ordu Province (Katrancı, 2019) can be attributed to the

influence of a single climate dominance in the given regions. The high biodiversity is directly related to the climate, ecosystem and habitat diversity in the region.
