ABSTRACT

In this study, 587 adult insect specimens belonging to the Crabronidae family (Insecta: Hymenoptera) were collected from Tokat Province between 2009 and 2012. Totally 89 taxa were identified, of which 68 are new records for the fauna of the province. As a result, the total number of species in the family is reached to 114 together with the previously known 46. All specimens were prepared as standard museum materials and deposited in Gaziosmanpaşa University, Faculty of Sciences and Arts, Department of Biology, Entomological Research Laboratory Tokat/Turkey.

Tokat İlinde Crabronidae Familyası (Insecta: Hymenoptera) Üzerinde Araştırmalar

ÖZET

Bu çalışmada Tokat ilinden 2009-2012 yılları arasında Crabronidae familyasına (Insecta: Hymenoptera) ait 587 ergin böcek örneği toplanmıştır. Toplam 89 takson tanımlanmış olup bunların 68'i il faunası için yeni kayittır. Sonuç olarak familyaya ait toplam tür sayısı daha önce bilinen 46'dan 116'ya yükselmiştir. Tüm örnekler standart müze materyali şeklinde hazırlanmış ve Gaziosmanpaşa Üniversitesi, Fen Edebiyat Fakültesi, Biyoloji Bölümü, Entomoloji Araştırma Laboratuvarı'nda (Tokat/Türkiye) depolanmıştır.

INTRODUCTION

Crabronidae family includes solitary wasps which are known as 'digger wasps', 'sand wasps', and 'mud dauber wasps' referring to their biologies and habitats. As implied by these names some of them make their nests by digging the soil while others daubing the mud gathered from all around. Although adult crabronids feed on nectar of flowering plants, their larvae feed on various insects such as mole-crickets, grasshoppers, aphids, honeybees, as well as spiders paralyzed and carried to the nest by the female wasps (Bohart and Menke, 1976). The family is currently represented by 9881 species in the World (Pulawski, 2018) and 485 species in Turkey (de Beaumont, 1967; de Beaumont, 1969; Pulawski, 1967; Pulawski, 1971; Hensen and van Ooijen, 1987; Tüzün et al., 1999; Gürmez and Tüzün, 2005; Straka, 2005; Ljubomirov and Yıldırım, 2008; Yıldırım, 2012; Çubuk and Gürmez, 2013).

Tokat province is located in the interior part of the Middle Black Sea region of Turkey which has suitable natural habitats for dwelling of insects. The altitude ranges from 250 m to 1900 m through the province, the northern parts are under the effect of wet Black Sea region climate, whereas southern parts are under the effect of dry Central Anatolian region climate. The vegetation of Tokat province is also distinct and unique in many aspects. Such as Euro-Siberian elements are on the North, while typical mountain steppe elements of Central Anatolian region on the South are dominant through the area. There are also Mediterranean vegetation remnants around Erbaa and Niksar (Kurt, 2006). This habitat diversity around the province brings about a rich fauna, so its biological diversity is worth investigating.

Recently, human impact on ecosystems such as rapid industrialization, pollution and urbanization has

caused the destruction of natural habitats, for this reason many insect species have faced the danger of extinction. Consequently, faunistic studies gained great importance not only for the detection of our biological richness but also for the monitoring of species under threat of extinction. There is no direct faunistic study about Crabronidae family in Tokat province prior to this one. Mostly foreign scientists have collected materials from Tokat province during their visits to our country (Guichard & Harvey, 1967; de Beaumont, 1967, de Beaumont, 1969; Pulawski, 1967; Pulawski, 1971; Gayubo et al., 2003; Gayubo & Özbek, 2005; Ljubomirov & Yıldırım, 2005). The aim of this study was to determine the current fauna of the family Crabronidae of Tokat province.

MATERIALS and METHODS

The number of specimens examined in this study is 587 which are belonging to the family Crabronidae (Hymenoptera). Adult wasps were collected by insect net from their natural habitats around Tokat province between 2009-2012. After they were killed and prepared as standard museum materials, specimens were identified by one of the authors (Gülmez) according to their original descriptions and/or keys in the following literature: de Beaumont (1961), Bitsch et.al. (1997, 2001), Nemkov (1996) and Pulawski (1971). Leica S6E stereomicroscope was used to examine the body parts of the specimens in detail. Within the text, all species are given in the subfamilies they belong and in systematic order. Turkey distribution of the species are given according to Ljubomirov and Yıldırım (2008) and Çubuk and Gülmez (2013). The material is deposited in the Entomological Research Laboratory, in Gaziosmanpaşa University, Tokat/Turkey.

RESULTS

Subfamily Astatinae Lepeletier de Saint-Fargeau, 1845

Astata affinis radoszkowskii Pulawski, 1957

Distributions in Turkey: Adana, Erzurum (Gayubo, Özbek and Yıldırım, 2003), Erzurum, Hatay, Konya, Kars, Osmaniye.

Material examined: Tokat, Zile, Edeköy Kızılızüm Yaylası, 660 m, 01.VIII.2009, 1 ♀.

Astata boops (Schrank, 1781)

Distributions: Adana, Afyonkarahisar, Ankara, Artvin, Aydin, Bilecik, Burdur, Çanakkale, Erzurum, Eskişehir, İçel, İzmir, Kahramanmaraş, Kayseri, Kars, Kocaeli, Konya, Rize, Tokat, Trabzon.

Material examined: Tokat, Erbaa, Kaleköy, 280 m, 25.IV.2010, 1 ♂; Tokat, Pazar, Akdağ, 1900 m, 04.VIII.2009 1 ♂; Tokat, Kampüs içi, 650 m, 07.VI.2010 1 ♂; Tokat, Toki ırmak kenarı, 620 m, 03.VII.2010 3 ♀♀.

Astata miegii scapularis Kohl, 1889

Distributions: Amasya, Ankara, Aksaray, Bilecik, Çankırı, Erzincan, Erzurum Gümüşhane, İzmir, Kars, Kütahya, Manisa, Tokat.

Material examined: Almus: Tufantepe, 850 m, 01.VII.2010 1 ♀.

Astata minor Kohl, 1885

Distributions: Ankara, Bilecik, Erzurum, Gümüşhane, Hatay, Kars.

Material examined: Tokat, Pazar, Akdağ, 1900 m, 04.VIII.2009 1 ♂; Tokat, Sulusaray, İlıcak Köyü, 1030m, 03.VII.2010 1 ♂; Tokat, Toki ırmak kenarı, 620 m, 03.VII.2010 1 ♂.

Astata rufipes Mocsáry, 1883

Distributions: Bitlis, Kars, Kütahya.

Material examined: Tokat Merkez: Toki ırmak kenarı, 620 m, 03.VII.2010 1 ♀.

Dryudella tricolor anatolica (Pulawski, 1967)

Distributions: Ankara, Artvin, Eskişehir, Kars.

Material examined: Tokat Merkez: Havaalanı, 650 m, 12.VII.2010, 1 ♀.

Subfamily Bembicinae Latreille, 1802

Alysson ratzeburgi Dahlbom, 1843

Distributions:

Material examined: Almus: Ormandibi Kasabası yolu 10. km, 900 m, 06.VII.2010 1 ♂.

Brachystegus scalaris (Illiger, 1807)

Distributions: Çankırı, Erzurum, İğdır, Kayseri, Konya, Sivas.

Material examined: Almus: Çevreli Kasabası, 900 m, 28.VII.2010, 1 ♂.

Nysson maculosus (Gmelin, 1790)

Distributions: Amasya, Ankara, Artvin, Erzurum.

Material examined: Tokat Merkez: Kampüs içi, 650 m, 07.VI.2010 4 ♀♀.

Gorytes foveolatus foveolatus Handlirsch, 1888

Distributions: Antalya, Bilecik, Bursa, Erzurum, Gaziantep, Hatay, Isparta, İstanbul, İzmir, Kahramanmaraş, Konya, Manisa, Muğla, Şanlıurfa, Şırnak.

Material examined: Tokat Merkez: Gijgij, 950 m, 18.VI. 2010 1 ♀.

Gorytes quinquefasciatus quinquefasciatus (Panzer, 1798)

Distributions: Ankara, Artvin, Batman, Bursa, Erzurum, Giresun, İçel, Kastamonu, Konya, Muğla, Tokat.

Discussion And Conclusion

89 taxa were identified belonging to Crabronidae family in this study, of which 68 are new records for the fauna of Tokat province. Therefore, the number of species belonging to Crabronidae family is reached to 114 from 46 for the province. The species identified in our study are shown below together with those in the literature (Table 1).

Some of the species recorded for the first time by this study for Tokat fauna had been known from only a few cities in Turkey (Ljubomirov and Yıldırım, 2008) namely: *Astata rufipes*, *Nysson maculosus*, *Oryttus concinnus paradisiacus*, *Liris atratus*, *Liris nigricans nigricans*, *Prosopigastra bulgarica*, *Tachysphex mocsaryi*, *Miscophus bicolor bicolor*, *Passaloecus corniger corniger* and *Trypoxylon minus*. The identification of these narrow-spread species in Tokat is an important record which contributes precious knowledge to the Crabronidae fauna of Tokat.

Crabronid wasps are flying very fast, they are solitary insects and some of them are very small, so some species can be overlooked easily during field studies. Similarly specimens with short flight periods or due to absence of road network to all habitats in the region, some species may have been missed. On the other hand lots of natural habitats have been destroyed recently due to the constructions of highways and dams or opening of sand mine enterprises in Tokat. This kind of adverse environmental impacts directly affects Crabronidae species which dig nest burrows in the soil, which may have caused some specimens to be overlooked.
